

It would be a big mistake to allow BPL to be implemented. Even if technology to eliminate interference was available which it is not, the power companies could not be trusted to properly use it and policing it would be a major job. I doubt the FCC has the capability to do that. The interference would not only seriously affect many amateur radio bands but also other users of HF and could easily extend down to the aviation LF/MF non directional beacon band and up to the 75 MHz marker beacon frequency, VOR/ILS frequencies of 108-118 MHz, and even communications frequencies of 118-136 MHz.

Allowing this scheme to be implemented would open such a mess of problems that the FCC would be swamped trying to respond to all of the complaints.
